

Three tickets, retested live on QA

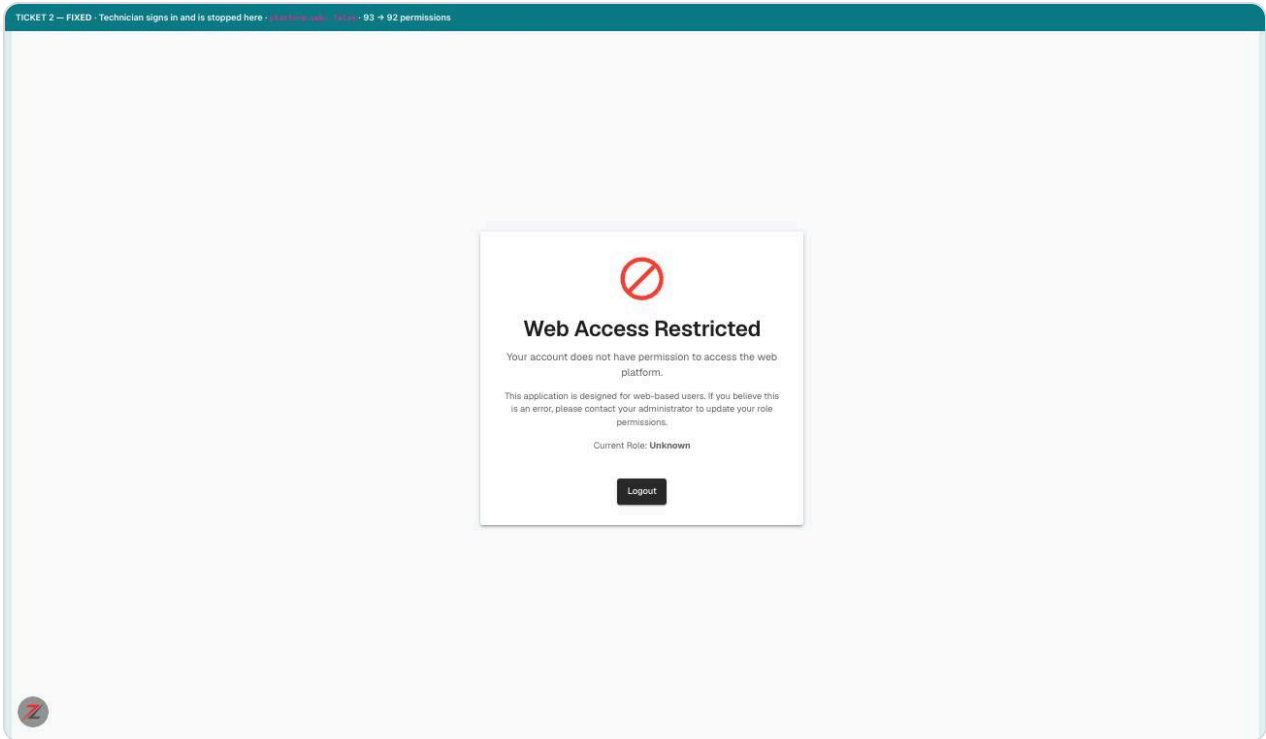

Each verdict is from a real QA session on 27 Aug 2026 — signed in through the login form, cookies and storage cleared between roles. Two are fixed; one has not been started.

Env `acme.qa.egalvanic.ai` Build `V1.36` Writes `none`

Technician web access FIXED	Quote generation 500 FIXED	Menu permissions NOT FIXED
---------------------------------------	--------------------------------------	--------------------------------------

FIXED Technician web access

A Technician can no longer log into the web portal

Signed in as the Technician — stopped at **Web Access Restricted**, exactly as the ticket's Expected result asked.

```
GET /api/auth/v2/me    as the Technician account
platform.web    false    (was true)
permissions     92       (was 93)
```

/dashboard → "Web Access Restricted"
/opportunities → also blocked

One note, not a regression: the fix removed `platform.web`, but the Technician still holds `quotes.approve`, `accounts.manage` and `data.export` (92 perms). Harmless on web now that they're blocked, but those still apply on mobile — worth a separate decision if that wasn't intended.

FIXED Quote generation 500

Quote generation no longer 500s — and the happy path works

TICKET 3 — Quote Generation 500 - FIXED

POST /api/plans/{id}/generate · acme.qa.egalvanic.ai · live 2026-08-27

1 · The exact plan from the bug (3ff9c375) — was 500, now a clean 400

POST .../plans/3ff9c375.../generate → HTTP 400 · 737ms
error : standard.pm_standard_id is required , success : false
That plan is an empty draft, so a validation 400 is correct. Before the fix this returned 500 Internal Server Error + trace_id.

2 · Happy path — a draft with a real pm_standard_id actually generates

POST .../generate {standard:{pm_standard_id}} → HTTP 200 · 558ms
generated plan · 71 assets · 312 covered
Not just "no longer 500" — quote generation genuinely works end to end.

No data was created; generate on a draft returns the computed plan without changing its status.

Both paths on POST /api/plans/{id}/generate, live 27 Aug.

the exact plan from the bug (3ff9c375):

POST .../generate → 400 "standard.pm_standard_id is required" (was 500 + trace_id)
that plan is an empty draft, so a validation 400 is correct

happy path (a draft with a real pm_standard_id):

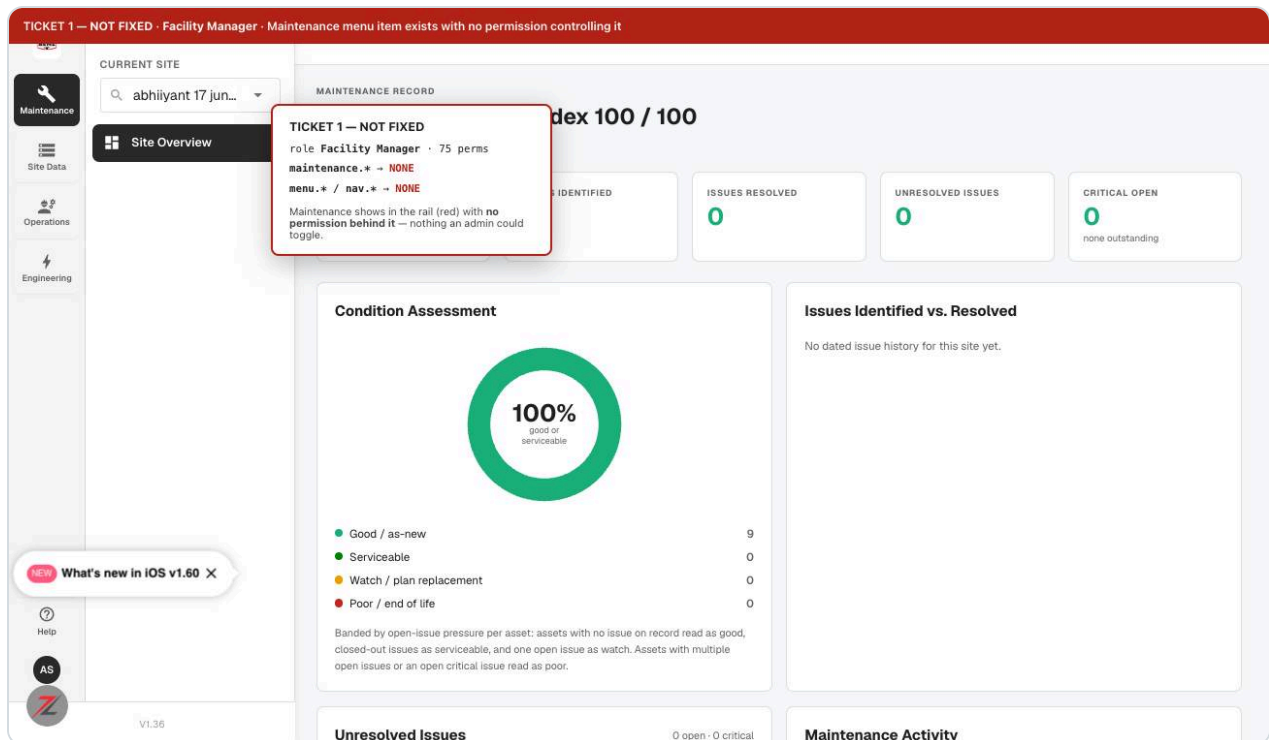

POST .../generate {standard:{pm_standard_id}} → 200 · 71 assets · 312 covered

Not just "no longer 500" — I generated on a populated draft and got a full plan back in ~0.6s. **One correction on my own method:** my first attempts returned 400 because I sent an empty body; the

endpoint needs `{standard: {pm_standard_id}}` in the request. That 400 was my payload, not the app.

NOT FIXED Make all menu options permission-based

No menu permission exists yet — the work has not been started

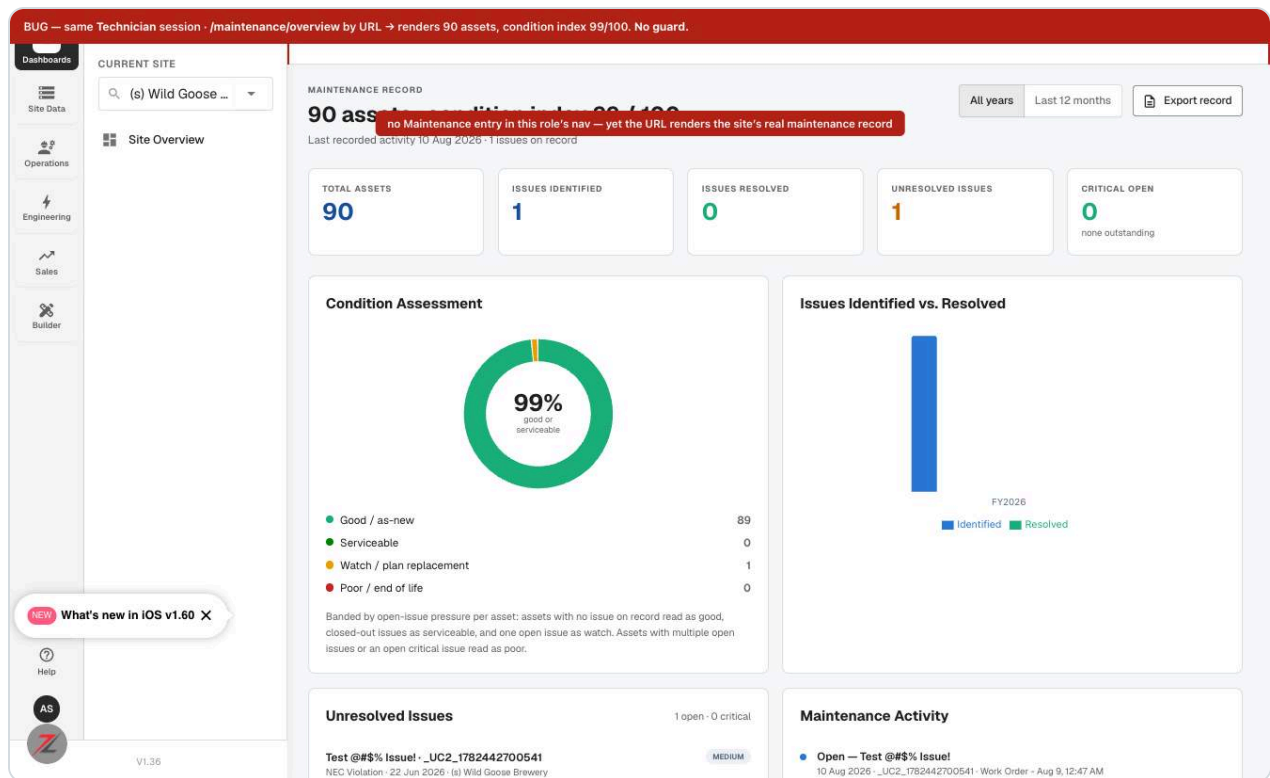

The Maintenance menu item shows in the rail, but `/auth/v2/me` holds no `maintenance.*` or `menu.*` permission to control it.

```
permissions matching maintenance.* -> NONE (Admin, Facility Manager, Client Portal)
permissions matching menu.* / nav.* -> NONE (every role)
```

Against the ticket's own acceptance criteria:

- ✗ Every menu option controlled by a permission flag — Maintenance has no permission at all
- ✗ No menu items hardcoded to always show — Maintenance still shows for Client Portal + FM, absent for Admin + PM, with nothing in the permission set driving it
- ✗ Disabling a permission hides the menu option — there is no permission to disable
- ✗ Admin can toggle menu visibility per role — nothing to toggle

The route is also still ungated — same gap as Bug 3a

A Technician with no Maintenance nav entry opens /maintenance/overview by URL and gets the full record. Every role can, Admin included — because there is no permission to check.

This ticket and Bug 3a are the same underlying gap. Fixing the menu-permission work properly — creating the permissions and gating both nav and routes on them — closes Bug 3a too. Worth linking them in Jira.

Verified live on QA, 27 Aug 2026. Sessions cleared between roles. No records created, edited or deleted — quote generation on a draft returns the computed plan without changing its status.
