

Re-verification: duplicate API endpoints — **NOT fixed**

QA environment `acme.qa.egalvanic.ai` · live probes 23 July 2026 (authenticated admin session) · original findings 17 July 2026 (Parallel Suite 3 `DuplicateApiAuditTest` + Suite 2 `ApiDuplicateCallTestNG`) · eGalvanic QA Automation

Verdict: the CRITICAL dash/underscore twin is NOT fixed — the broken behaviour reproduces today, unchanged.

The development team reported this fixed. Re-probing live on 23 July 2026:

- **Both spellings are still registered** in the live `/api/swagger.json`: **6 dash paths + 12 underscore paths** (17 Jul: 6+13) — write methods (create/update/delete/hard-delete) exist on *both* sides.
- **The underscore list read still ignores pagination and never answers**: GET `/api/planned_workorder_line/?page=1&per_page=5` was aborted after **45 s with no response** — the exact 17 Jul signature ("TIMEOUT 36 s+, unbounded read"). Probed in a simultaneous race where a control endpoint answered in **0.7 s**, so this is the endpoint, not the backend.
- **The one thing that changed made it worse**: the paginated dash list `/planned-workorder-lines/` **still answers live** (HTTP 200 in **1.4 s** in the same race — identical to 17 Jul) but has been **removed from the spec**. The working route is now undocumented while the spec advertises only the broken one.
- Bounded reads on the same resource answer (`by-workorder/{id}` → HTTP 200 in 2.6 s in the race), proving the resource itself is reachable — the defect is specifically the unpaginated list implementation.

The runtime (frontend) duplicate — GET `/sites/{id}/status` fetched twice on one dashboard load (once with `?narrative=false`, once bare) — **also still reproduces** (screenshot below).

Evidence — live screenshots (23 Jul 2026)

This page IS <https://acme.qa.egalvanic.ai/api/swagger.json> (authenticated session), rendered for readability · 2026-07-23T13:06:31.190Z · 968 paths in spec

This page IS <https://acme.qa.egalvanic.ai/api/swagger.json> (authenticated session), rendered for readability · 2026-07-23T13:06:31.190Z · 968 paths in spec

Path	Methods
/api/planned-workorder-line/create	POST
/api/planned-workorder-line/bulk-create	POST
/api/planned-workorder-line/update/{line_id}	PUT
/api/planned-workorder-line/delete/{line_id}	DELETE
/api/planned-workorder-line/hard-delete/{line_id}	DELETE
/api/planned-workorder-line/{line_id}	GET

△ /planned-workorder-lines/ (paginated LIST — HTTP 200 in 1.4 s, still answers live) is NOT in the spec anymore

Path	Methods
/api/planned_workorder_line/	GET, POST
/api/planned_workorder_line/by-workorder/{workorder_id}	GET
/api/planned_workorder_line/{line_id}	GET, PUT, DELETE
/api/planned_workorder_line/{line_id}/hard-delete	DELETE
/api/planned_workorder_line/bulk-update	POST
/api/planned_workorder_line/analyze-removal	POST
/api/planned_workorder_line/bulk-remove	POST
/api/planned_workorder_line/{line_id}/available-procedures	GET
/api/planned_workorder_line/{line_id}/procedures	PUT
/api/planned_workorder_line/{line_id}/activation-details	GET
/api/planned_workorder_line/{line_id}/activation	PUT
/api/planned_workorder_line/activation-bulk	PUT

NOT FIXED (23 Jul 2026): 6 dash + 12 underscore paths — one resource, two route families. Writes (create/update/delete/hard-delete) exist on BOTH sides, and the only LIST in the spec (GET /planned_workorder_line/) ignores pagination and times out (45 s, no response).

Screenshot 1 — live /api/swagger.json (rendered for readability, 23 Jul 2026 13:06 UTC): the resource is registered under BOTH spellings — 6 /planned-workorder-line/* (dash) + 12 /planned_workorder_line/* (underscore) paths, write methods on both sides. Note the warning: the paginated dash list /planned-workorder-lines/ is no longer in the spec (though it still answers live).

LIVE PROBE – planned workorder line, duplicate-spelling endpoints · https://acme.qa.egalvanic.ai

Authenticated session · all 4 requests fired SIMULTANEOUSLY at 2026-07-23T12:54:19.402Z (after backend health re-confirmed; control endpoint answers ~1 s)

GET request (credentials included)	Elapsed	Result
/api/planned_workorder_line/?page=1&per_page=5 THE BUG – underscore LIST, pagination requested (page=1, per_page=5)	27.1 s	PENDING – no response yet
/api/planned-workorder-lines/?page=1&per_page=5 dash LIST – answered HTTP 200 in 1.4 s on 17 Jul; removed from today's spec	1.4 s	HTTP 200 · 2062 bytes
/api/planned_workorder_line/by-workorder/00000000-0000-0000-0000-000000000000 bounded read, SAME underscore resource – proves the resource is reachable	2.6 s	HTTP 200 · 51 bytes
/api/action-items/counts control – unrelated endpoint, shows backend is healthy during this probe	0.7 s	HTTP 200 · 94 bytes

Screenshot 2 — live probe on the authenticated session (12:54:19 UTC), all 4 requests fired SIMULTANEOUSLY: the dash list answered in 1.4 s, the bounded by-workorder read in 2.6 s, the control in 0.7 s — while THE BUG (underscore list, pagination requested) is still hanging with no response at 27.1 s.

LIVE PROBE – planned workorder line, duplicate-spelling endpoints · https://acme.qa.egalvanic.ai

Authenticated session · all 4 requests fired SIMULTANEOUSLY at 2026-07-23T12:54:19.402Z (after backend health re-confirmed; control endpoint answers ~1 s)

GET request (credentials included)	Elapsed	Result
/api/planned_workorder_line/?page=1&per_page=5 THE BUG – underscore LIST, pagination requested (page=1, per_page=5)	45.0 s	✖ TIMED OUT – aborted after 45 s, NO response (unbounded read, pagination ignored)
/api/planned-workorder-lines/?page=1&per_page=5 dash LIST – answered HTTP 200 in 1.4 s on 17 Jul; removed from today's spec	1.4 s	HTTP 200 · 2062 bytes
/api/planned_workorder_line/by-workorder/00000000-0000-0000-0000-000000000000 bounded read, SAME underscore resource – proves the resource is reachable	2.6 s	HTTP 200 · 51 bytes
/api/action-items/counts control – unrelated endpoint, shows backend is healthy during this probe	0.7 s	HTTP 200 · 94 bytes

Backend healthy (control 0.7 s) – ONLY the spec-advertised underscore list hangs. The working dash list (1.4 s, same speed as 17 Jul) was removed from the spec instead of being made canonical.

DATA

V1.34

Rows per page: 25

1-2 of 2

Screenshot 3 — the same probe at completion: GET /api/planned_workorder_line/?page=1&per_page=5 aborted after 45 s with NO response (unbounded read, pagination ignored) — the exact 17-Jul signature. Every other row answered normally, proving the backend was healthy and the failure is specific to this endpoint.

DUPLICATE FETCH ON ONE /dashboard LOAD – https://acme.qa.egalvanic.ai

Entries from the dashboard page's own performance.getEntriesByType('resource') log · page loaded 2026-07-23T12:16:14.653Z (authenticated admin, site test-no-account)

· times are ms since page start

Request URL	Started at	Duration
/api/sites/825b59ac-c440-4f92-b395-e289b93e360a/status?narrative=false variant 1 – with ?narrative=false	41043 ms	630 ms
/api/sites/825b59ac-c440-4f92-b395-e289b93e360a/status variant 2 – bare, SAME resource, started 1 ms later	41044 ms	659 ms
/api/users/77e99d86-7f0a-4345-b056-6f470bb668ec/roles (for comparison: /users/{id}/roles fired ONCE on this load)	26567 ms	332 ms

GET /sites/{id}/status fetched TWICE on one page load (2 query variants, 1 ms apart, both completed ~630/659 ms) – the 17-Jul runtime finding, still present 23 Jul. One of the two calls is redundant.

DATA

V1.34

Rows per page: 25

1-2 of 2

Screenshot 4 — /dashboard load (12:16:14 UTC), entries from the page's own resource-timing log: GET /sites/{id}/status fired TWICE on one load, 1 ms apart (variant 1 with ?narrative=false, variant 2 bare). The frontend redundant-fetch finding from 17 Jul is also still present. (/users/{id}/roles fired once on this load.)

Where CI now tracks this — Parallel Suite 3

DuplicateApiAuditTest (suite suite-api-health.xml, "API Duplicate-Endpoint Audit") gained two **FIX-CHECK tripwire tests on 23 Jul 2026**. They hard-fail every run until the fix contract genuinely holds — so the suite itself now answers "is it fixed yet?":

Test	Fix contract it enforces	Status today
testFixCheckUnderscoreListPaginates	GET /planned_workorder_line/?page=1&per_page=5 answers HTTP 200 in <10 s honouring pagination	RED — no response in 35 s (socket timeout)
testFixCheckSingleSpelling	the resource exists under ONE canonical route family (not both spellings)	RED — 6 dash + 12 underscore

Both tests **skip** (never false-fail) when a control endpoint shows the QA backend is in one of its ambient 502/504 degradation episodes — during this re-verification one such episode occurred and even `/action-items/counts` returned 502 after 41 s, so the guard is not hypothetical.

Reproduce it yourself (~1 minute)

```
TOKEN=$(curl -sk https://acme.qa.egalvanic.ai/api/auth/login -H 'Content-Type: application/json' \
-d '{"email":"<qa-admin>","password":"<password>","subdomain":"acme"}' | python3 -c 'import sys,json;print(json.load(sys.stdin)["access_token"])')

# 1. THE BUG – hangs (unbounded read, pagination ignored). Ctrl-C when bored:
time curl -sk -H "Authorization: Bearer $TOKEN" \
'https://acme.qa.egalvanic.ai/api/planned_workorder_line/?page=1&per_page=5' -o /dev/null

# 2. Control – the SAME resource, bounded, answers fine:
time curl -sk -H "Authorization: Bearer $TOKEN" \
'https://acme.qa.egalvanic.ai/api/planned_workorder_line/by-workorder/<any-wo-uuid>' -o /dev/null

# 3. Both spellings still in the spec:
curl -sk https://acme.qa.egalvanic.ai/api/swagger.json | python3 -c \
'import sys,json; ps=json.load(sys.stdin)["paths"]; \
print(*[p+" "+str(list(ps[p])) for p in ps if "planned" in p and "line" in p], sep="\n")'
```

Recommended fix (unchanged since 17 Jul — none of it has happened)

1. **One canonical route family** (the dash form, matching the rest of the v1.35 API); move ALL methods onto it.
2. **Restore a paginated list read** — the removed `/planned-workorder-lines/` honoured `page/per_page` and answered in 1.4 s; the surviving underscore list scans unbounded and times out.
3. **Alias or 410 the underscore family** so the two registrations cannot drift further (they already have: writes on both sides, different path shapes).
4. Frontend quick win: collapse the dashboard's two `/sites/{id}/status` variants into one call.
