

Re-verification — GET /planned_workorder_line/ timeout

Component: Backend API — Work Order Service · Environment: QA `acme.qa.egaltanai` (badge V1.36) · Verified: 2026-07-31, authenticated Super-Admin session (cookie auth)

🛑 **NOT FIXED — the endpoint still does not return; pagination does not help; unknown ids do not fail fast.**

The bare collection **and** the suggested `?page=1&per_page=5` variant both hit a client read timeout at 30 s (and a CloudFront 504 at ~181 s earlier today). A bounded query on the same table returns in ~1 s, confirming the ticket's "unbounded list / scaling" diagnosis is still live.

Timed probes (this session)

Request	Result	Time	HTTP	Body
GET /planned_workorder_line/ (bare collection – the ticket)	TIMEOUT	> 30,000 ms	none	No response within a 30 s client read window. Earlier today the same call returned a CloudFront 504 after 181,247 ms.
GET /planned_workorder_line/? page=1&per_page=5 (the Suggested-Fix pagination)	TIMEOUT	> 30,000 ms	none	Adding <code>page / per_page</code> does not help — identical hang. (CI 2026-07-30 also: 35 s socket timeout with these params.)
GET /planned_workorder_line/00000000- 0000-0000-0000-000000000000 (unknown id)	200 + HTML	~1,305 ms	200	Returns the SPA index shell, not a 404 — a client cannot tell the resource is absent (masking). Expected: fast 404.
GET /planned_workorder_line/not- a-uuid (malformed id)	500	~1,089 ms	500	<code>{"error":"An internal error occurred.","success":false,"trace_id":"9eb0ff51...367a"}</code> — sanitized (no SQL leak), but a 500, not a 404.
GET /planned_workorder_line/by- workorder/<id> (bounded variant – baseline)	200	~1,089 ms	200	<code>{"count":2,"lines":[...]}</code> — a bounded query on the SAME table is fast. This is the fast path the UI actually uses.

Timing method: each request fired concurrently and awaited on a page global; the two hanging calls used a 30 s `AbortController` (the ticket's "client-side read timeout"). Fast-path timings are from an unblocked run (a re-run inflates them because the hanging calls head-of-line-block the connection).

Assessment against the ticket's Expected Result

Requirement	Status
Return within the standard performance SLA	NOT MET — >30 s / 504 at ~181 s
Pagination (<code>page + per_page</code>) combined with <code>query-plan / index fix</code>	NOT MET — <code>page/per_page</code> still times out
Unrecognized resource id fails fast with 404	NOT MET — unknown id → 200+HTML; malformed → 500

Interpretation

- The reliability defect is **unchanged**: the collection endpoint is still effectively down at scale — it does not return, so the client sees a read timeout rather than any HTTP status (exactly the ticket's "Actual Result").
- The Suggested-Fix pagination is either not deployed or not effective on this route — `?page=1&per_page=5` hangs the same way. The `query-plan / index` audit the ticket pairs with pagination appears still outstanding.

- The bounded `by-workorder/<id>` path answering in ~1 s on the same table shows the data volume is servable when the query is scoped — supporting "unbounded list read" as the root cause, not raw table size.
- The fast-404 sub-requirement is also unmet: an unknown id falls through to the SPA shell (200 + HTML) and a malformed id 500s; neither is a fast, honest 404.

Corroboration: session probe earlier today — bare endpoint → CloudFront 504 after **181,247 ms** (x-cache: Error from cloudfront). CI Parallel Suite 3 (2026-07-30): GET `/planned_workorder_line/?page=1&per_page=5` → socket timeout at 35,043 ms ("NOT FIXED — unbounded list read that never returns"). Frontend caller & scope: see docs/bug-evidence/planned-workorder-line-timeout/EVIDENCE.md.
